At present, text-oriented and operational information systems are used mainly in the fields of commerce, industry and public welfare, such as stock control, automatic computation, automatic dispensing, automatic classification, and automatic management for business and public welfare affairs. In a text-oriented and operational information system, a database is created via the storage and retrieval of the information, thus ensuring the continuity of the information storage and retrieval. A text-oriented and operational information system is particularly advantageous when, for example, the information about different goods or commodities must be stored in multiple formats. In addition, a text-oriented and operational information system saves costs and effort in information retrieval and analysis by providing textual data when necessary. Text-oriented and operational information systems may be divided into two categories: a relational information system, and a non-relational information system. A relational information system is an information system that stores data in tables for record-based information, and retrieves data for record-based information. Relational information systems can store various kinds of information, but, on the other hand, it cannot deal with the continuously changing of information. A non-relational information system is an information system that stores data in files for information, and retrieves data for file-based information

Optically glass fiber is a medium with the advantage of great light wave propagation, reliable operation and easy to. Optical glass fiber consists of silica glass which is a kind of glass. The optical glass fiber is primarily used for telecommunications and other communications. It is a kind of glass optical fiber that can transmit various signals. There are several types of glass optical fiber and each type has a unique character. In general, glass optical fiber can be divided into two categories.A pharmacokinetic study of a new, sustained-release contraceptive pill (1 mg ethinyl estradiol/30 µg levonorgestrel in a vaginal-ring system). To evaluate a new contraceptive containing ethinyl estradiol (EE) and levonorgestrel (LNG) formulated in a vaginal-ring system (combined EE/LNG) with regard to safety, contraceptive efficacy, and pharmacokinetics. In this randomized, controlled, non-blinded, multicenter study, 122 subjects were randomized into three groups. Twenty-four subjects were treated with a combined EE/LNG ring containing 1 mg EE and 30 µg LNG. Subjects also took oral placebo for 28 days, then received two additional doses of the ring, followed by once-daily oral placebo for 14 days. Eighty-eight subjects who agreed to repeat the double-blind phase were randomized to receive either one 40 µg EE/0.075 mg LNG (29 subjects) or one 40 µg EE/0.12 mg LNG (59 subjects) ring. The EE and LNG levels in plasma were determined with a validated mass spectrometry assay. Mean (SD) plasma concentrations were 1.83 (0.30) pg/mL for EE and 0.07 (0.03) ng/mL for LNG for the lowest EE/LNG dose. The EE and LNG concentrations for the 40 µg EE and 0.075 mg LNG vaginal rings were 1.75 (0.32) pg/mL and 0.05 (0.02) ng/mL, respectively, and for the EE and LNG vaginal rings were 2.55 (0.37) pg/mL and 0.08 (0.04) ng/mL, respectively, after completion of the three-ring regimen. The percentage of breakthrough bleeding by days 2, 7, 14, and 21 was 29%, 5%, 3%, and 5% for the lowest EE/LNG vaginal ring, 40 µg EE/0.075 mg L
